

Node

- Cross-platform JavaScript run-time environment
- Built on Chrome's V8 JavaScript engine
- Executes JavaScript code outside of a browser.
- Open-source
- Written in C++
- Event-driven architecture capable of asynchronous I/O
- Node.js combined Google's V8 JavaScript engine, an event loop, and a low-level I/O API.

A bit of history

- Node was written by Ryan Dahl in 2009

“Dahl was inspired to create Node.js after seeing a file upload progress bar on Flickr.

The browser did not know how much of the file had been uploaded and had to query the Web server. Dahl desired an easier way.”

Node Modules

Core Modules

- Path, fs, http etc
<https://nodejs.org/dist/latest-v10.x/docs/api/>

3rd party modules

- Npm library

Custom Modules

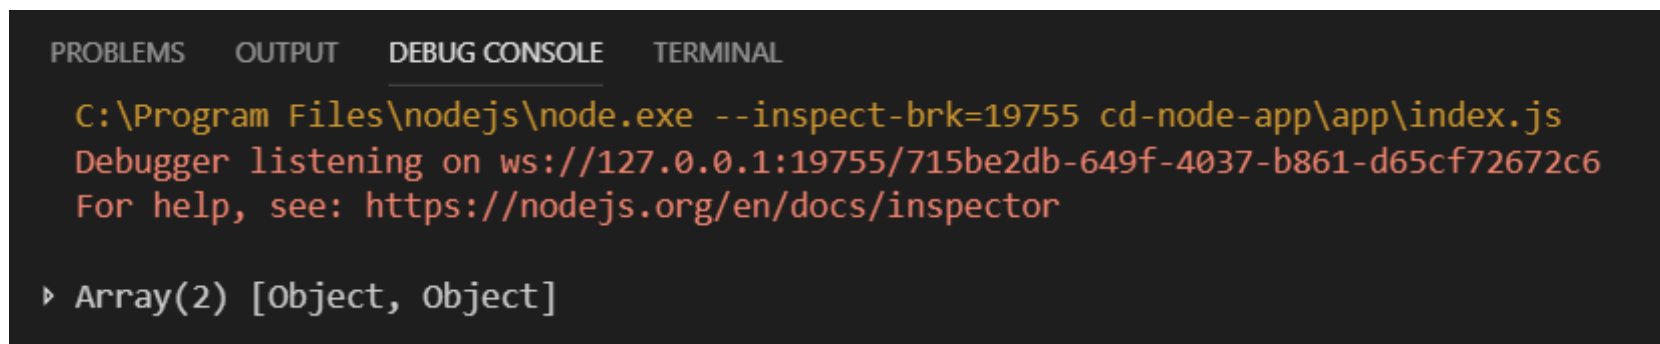

- Specific to projects

Debugging Node Apps

12 `product.getDetails()`

Build a node server & Deploy on Cloud

- Set up Heroku
- Configure the project
- Deploy to Heroku
- Test the application

Heroku is a cloud platform as a service supporting several programming languages. Heroku, one of the first cloud platforms, has been in development since June 2007, when it supported only the Ruby programming language, but now supports Java, Node.js, Scala, Clojure, Python, PHP, and Go.
